Industry applications such as Autodesk Inventor, software engineering tool for 3D modeling, is based on the same technology used to create Autodesk Fusion 360. Autodesk allows the selling of digital and physical products on the application store Autodesk Exchange Apps. The products are typically add-ons to Autodesk software. The Autodesk Exchange Apps allow people to create digital drawings, use Autodesk program utilities and to display presentations.

History At the beginning of the 1980s, Autodesk was a pioneer in computer-aided drafting and design. Autodesk products were the first to offer vector-based technology for 3D models, which gave its customers a new way to create their own products, and to perform advanced engineering applications. Autodesk technology helped to usher in the CAD revolution. In the early 1990s, Autodesk products were pioneering new approaches in collaborative applications. By the late 1990s, Autodesk products were leading the next wave of innovation with file-based collaborative applications, and the company's strategy was to offer design tools for all types of users. In the mid- to late-1990s, Autodesk created a unique way to integrate the process of design and production. Its unique ability to link design to production was at the core of Autodesk Inventor, a product that incorporated industry-standard engineering technology. Inventor enabled users to create virtual prototypes that allowed them to visualize a wide range of products and make them better than ever before. Autodesk Inventor ultimately allowed its customers to take the design of their products to the next level, driving adoption, improving

profitability, and creating a better overall experience. In the 2000s, Autodesk products began to incorporate and extend the capability of digital media, providing easy, secure ways to send and receive information and materials. The popularity of the Internet increased demand for the Autodesk Exchange Apps, and Autodesk continued to offer a great range of apps to meet the needs of users of its programs. In 2012, Autodesk launched Autodesk 3D Fusion to the public. Fusion offered a unique and powerful set of capabilities to create and combine 3D models, graphics and data. Fusion also helped customers to leverage their existing data, so they could bring it to life with tools they already had. It offered a new approach to the creation of design products that were never before possible.

Combined effects of multi-walled carbon nanotubes and co-occurring MnO₂ nanoparticles on removal of toxic metal ions from water. A nanocomposite of multi-walled carbon nanotubes (MWCNT) and MnO₂ nanoparticles (MNPs) was prepared and applied for removal of toxic metal ions. The influences of parameters including pH, amount of MWCNT, MnO₂ and contact time on adsorption were systematically investigated. The results showed that the MWCNT-MnO₂ nanocomposite has a great potential for treatment of Zn²⁺, Cd²⁺ and Pb²⁺ from the aqueous solution. Furthermore, the adsorption rate of Zn²⁺, Cd²⁺ and Pb²⁺ on MWCNT-MnO₂ was higher than that on raw MWCNT. The adsorption kinetics data showed that the adsorption of Zn²⁺, Cd²⁺ and Pb²⁺ onto MWCNT-MnO₂ followed the pseudo-second-order model. With increasing the MnO₂ dosage, the adsorption of Zn²⁺ and Cd²⁺ decreased, while the adsorption of Pb²⁺ increased. And, the ratio of Mn/Zn and Mn/Cd in MWCNT-MnO₂ increased significantly. The adsorption of Zn²⁺, Cd²⁺ and Pb²⁺ was observed in the order: Pb²⁺ > Cd²⁺ > Zn²⁺. Thermodynamic studies indicated that the adsorption of Zn²⁺, Cd²⁺ and Pb²⁺ on MWCNT-MnO₂ was a spontaneous and exothermic process.

Multiple arterial aneurysms associated with a long segment occlusive iliac artery disease. Case report. A patient with multiple arterial aneurysms associated with a long segment occlusive iliac artery disease is presented. Following surgical correction of the iliac artery disease, a conventional aortofemoral bypass was done. Postoperative aortography revealed no residual
