Brute force crackers are trying every possible combination of letters.Q: In Java, should there be a comma at the end of an exception handler block? I was reading Oracle Java Tutorial about exception handler and there were two different ways to write the exception handler: //1st way try{ ... } catch(Exception e){ ... } catch(Exception e){ // do something } //2nd way try{ ... } catch(Exception e){ // do something } catch(Exception e){ // do something } I am not sure if there is any difference between the two. A: Both are correct. It's just a matter of formatting. As written, if there are 3 exceptions, the second version would wrap them all in the first one. To avoid that, you just have to add a comma after the last exception handler. A: Both code snippets are absolutely correct. I'd write the 2nd one like this: catch(Exception e){ // do something } catch(Exception e){ // do something } catch(Exception e){ // do something } To make it more readable, and as an alternative to two separate catch blocks, you could use re-throw like this: catch(Exception e){ // do something } catch(Exception e){ // do something } catch(Exception e){ // do something } A: Both versions are correct. You can write the second way just to make it a little bit more readable and compact: catch(Exception e){ // do something } catch(Exception e){ // do something } Comprehensive care: validation of self-reported disease-specific health-related quality of life and utility scores in the Olmsted County, Minnesota, stroke population.
