The RuntimePack Product Key is a small package containing a single download, which includes the necessary C++ runtime libraries and components for installation and.Net Framework 4.5. For Visual Studio 2012 and 2013, MSVC will have to be downloaded separately. The RuntimePack comes with the Microsoft.Net Framework 4.5, as well as the individual components. If you work with an older Visual Studio version, not all components will be installed in all cases, so it might be worth to read the list of features and libraries it includes. From the publishers' point of view, RuntimePack is a tool that includes most of the Windows libraries and components for application development and debugging, and thus, should be of special interest to developers. It brings together a single installation, one single configuration process, and eliminates the need to look for and download individual components separately, which is always time consuming and error prone. Another benefit of the RuntimePack is that it registers all system DLL and OCX files without requiring manual interventions, which eliminates the need to hunt for missing libraries. Though sometimes, the system DLLs are not fully registered or installed, and the application crashes as soon as it launches, as well as when launched under debugging mode, which is a clear indication that one of the missing DLLs is the actual culprit. To avoid such situations, the RuntimePack includes a system DLL that can be used to register all the missing files. In the case of missing system DLLs, most of them are registered by the RuntimePack, either directly or indirectly through system registry entries. In other cases, where the missing DLLs are incompatible with the underlying Windows version, the RuntimePack allows to patch existing system files to fix the issue. The RuntimePack is not intended for setup and deployment, as its only purpose is to get rid of error messages and nag screens during application execution, and thus, can safely b7e8fdf5c8
