Instead of waiting a few days to know whether the manufacturing company has provided their device to the Indian market, or if the company has delayed its shipment, you could get a more precise appraisal of the situation in India, and also get a hint of a possible new release date for the product, in less time than it takes for the international shipment to arrive. Starting today, the good people over at Phoronix have started a Canonical "packages" database feature, an effort to standardize our coverage and development of Ubuntu packaging repositories for the Ubuntu 16.04 LTS (Xenial Xerus) release. So, if you want to know how the 16.04 LTS packaging repositories are progressing and make sure you know the latest versions that are available for you to upgrade to, then you should head on over to Phoronix. Since Ubuntu 16.04 LTS (Xenial Xerus) is making its way into the wild, it's a good idea to be keeping a close watch on the development of it, since it's a feature release and may be prone to any number of bugs and issues that do not usually show up in the non-LTS versions of the distro. Ubuntu 16.04 LTS (Xenial Xerus) releases are currently on track for the official release on April 24, 2016. If you don't want to wait until April 24th, you can grab the release candidate for Ubuntu 16.04 LTS (Xenial Xerus) from our website. If you're new to Ubuntu (or Linux) you'll be very happy to know that there's a new three step installer to help you get started with Ubuntu, as well as other aspects of the Debian-based operating system. Firstly, you'll be greeted by the Ubuntu Software Centre, which is a way of managing your applications, software, installable programs, software updates, your desktop and various application settings. If you want to learn more about the Ubuntu Software Centre, click here. The second step of the new Ubuntu installer will be to choose if you want to install or not, and to change the default Ubuntu operating system language. If you're happy with the default operating system language, and you don't have to change it, then everything will be installed to the default setting. The third step will be to choose what you want to do with your newly

Is there some overload of operator= that happens in the first case to "de-reference" s, but not in the second case? Also, how is `const` applied to a named constant? A: When you define `const std::string& s = "foo";` It is kind of like a pointer definition, which means that you are now assigning a value to a pointer. That's why you see the expected error from pointer overload. However, when you just declared it, as in `const std::string s = "foo";` Then you have a variable assignment, which doesn't require a pointer overload. Therefore, it's working. There is no difference between a named constant and a typedef. So, I believe that the declaration `const std::string s = "foo";` and `const std::string& s = "foo";` are equivalent. Hope that helps. Turtle Tax Turtle Tax was the name of an early wildlife preservation scheme in New Zealand for the protection of the natural habitat for the introduced (often localised) species of the land, marine and freshwater environments. 6d1f23a050
