Boredom Was a Good Thing?

For 2 million years, humans, living in savannas and forests, hunted animals to eat. Not too long ago, they worshipped gods. Now, get ready. Here comes a different kind of hunt. A hunt for meaning. We will soon be taking the first steps into a world in which we might not be bored, at least not all the time. Trouble is, you need the right tools to tackle a task as huge as this. Which is why it's not surprising that the search for meaning has led to a new

science - positive psychology.

This is the science that examines not what defines happiness, but how to make people happier, more productive and more fulfilled. There's a place for this kind of science. After all, what better day in the office to spend an hour or two listening to Edwig Van Beethoven's 6th symphony than on the most momentous day in the history of human evolution? The latest wave of positive psychology research

examines the roots of human happiness and is examining where meaning comes from in our lives. Like many a hunt, it's not easy to spot the prey – or even to label it as a goal. But just in case, the seekers are on the lookout for unexpected sources of meaning – like an afternoon of beachcombing in a favorite seaside town, for example. One thing leads to another. Once you see an opportunity to explore the source of meaning, you might start

craving adventure. And then you can start expanding your notion of what is meaningful to include, say, a morning spent hiking in a forest. Or a morning spent with your sweetheart. Or a morning spent sailing in the ocean. One might lead to another and another. Eventually, your quest for meaning could expand into a career you never dreamed you'd have. In most cultures, the hunt for meaning is wrapped up with great sex, social

achievement, travel or simply enjoying life. There's no shortage of "meaning." But now let's take this notion of what happens when you hunt down meaning, turn it around and ask the question: Does boredom lead to a life of meaning? Research suggests that boredom can be the gateway to positive human growth. For example, one study by British psychologist Nigel Barber and his colleagues showed that people who suffer from stress

and depression often return to their lives with the hope of finding greater meaning.

Over the last decade, researchers have followed up on these earlier studies and now see the promise of boredom in the growth of human connection and meaning. One study by Australian psychologist Catherine Steger and her colleagues provides an example. The researchers recruited a group of 8-11 year-old children and asked them

to write an essay about what they liked doing most in school, and what they did to entertain themselves.

Children who scored at the 85th percentile on this test were asked to do a simple experiment to measure their boredom. They were instructed to watch a video of a puppy for six minutes - a task that many a parent can attest to. The children who scored above the 80th percentile scored significantly higher on tests of empathy

and emotional regulation. That is, they could better regulate their moods by shifting their attention in attentional control, and their ability to connect with others. It's likely that children of this age group experienced boredom as a normal part of life. 5ec8ef588b
