Keymacs are small, low power and low cost key switches that can be programmed with microcontrollers and single board computers. Programmable keymacs are becoming more and more popular, as they give you the ability to make adjustments to a particular function and/or power on/off to an individual system. Use Keymacs in your next project with the following features. ? Simple setup with no hardware soldering required ? Supports a standard 4-pin relay module ? Supports programming using an Atmel ATtiny or ATtiny 25 or ATtiny 40 microcontroller ? Detachable push button actuator module for easy access ? Connect a battery backup for system power This project will help you design and build a system that will read and display the current state of a specific function in your house. The system will use a microcontroller to read the values from a three pin keyswitch and send the readings to a relay module which will turn an LED on or off depending on the state of the key switch. You can use two switches for two different functions. You will have to make some minor modifications to the existing code in this project so you can read data from one or two switches and program the relay module to operate in different ways depending on which key switch you use. In this project, we will program a few key switches to send a message to our microcontroller and have our microcontroller print the text to the screen. This project will allow you to program an Atmel ATtiny microcontroller and one or more key switches to monitor and send text messages to a serial monitor. This project includes the ATtiny2613, an Atmel ATtiny 25, a Microchip PIC16F1554 and a TX9021 key switch. You will need some 3.3v to 5v level shifter, a key switch, a power switch, and a microcontroller project includes an Atmel ATtiny 25 microcontroller project includes an Atmel ATtiny 25 microcontroller shat allows you to monitor and control a DC lighting system for special effects. The system contains a relay, an AC power source and a 6-24v supply. The microcontroller h
