You work quickly, list it only takes a few touches to change a parameter, squares of the screen are minimized when you're not using it, the interface is simple and the keyboard is not missed. Even small mistakes made on the tablet are immediately visible in Photoshop. A particular advantage is that you can also work in landscape mode on a tablet with the tablet is horizontal as well, which is perfect for editing a photo. In fact, you can also open the same photo on the PC side to adjust it here as well as on a mobile device, and see the differences in the screenshots and automatically upload them. Editing on a tablet does not mean that the efficiency is lacking in other areas. The tablet version of Photoshop is very powerful, there are no problem with either speed or stability. The only problem that is annoying, is that there is no option to save after each update. It's also useful for updates not to appear automatically. iOS is one of the most secure operating systems, released only well-known supported apps. iOS is one of the easiest platforms for developing applications. The interface is simple, just as by coding an application. In addition, iOS developers can use the App Store practically without any effort. It is worth mentioning that adding a disabling feature to the app is not very practical. Because that means hiding the "settings" button, then it is not possible to prevent users from changing the system parameters. On the other hand, this also means that developers will not know whether the users have set certain preferences. Because iOS users can use almost every app and hackers from the app store can open communication with the user device, it is very difficult for an iOS user to be cautious.
