Adobe has upped Photoshop's minor strength in the Face toolbox with its new **Face Recognition**, which means you no longer need to screw around with the rulers on your face or try to edit it by eye. Using computer vision, the app can now tell you how to make your most amazing face (you'll need to tone your skin, apply some makeup, and look in the mirror, of course). Adobe is really pulling out all the stops to make Photoshop stand out for the iPad Pro. I'm just now feeling comfortable enough with Photoshop CC on the smaller display to really push it to its limits and see if it can function as well as it does on my PC monitor. The interface is as intuitive and responsive as Photoshop has ever been, and the features are among the best currently available. Photoshop CC is not a fast processor. In fact, Photoshop CC may even be the first major application in recent memory to lock up if you're not careful with your multi-window usage, but the performance I've tested so far has been quite acceptable. I've been able to make some fairly complex edits, including retouching, adding custom textures to objects, and building a double pyramid with Repetto. I have a feeling the possible performance improvements Adobe has been working on will be very helpful, especially to those of us with older machines. Performance Issues: Photoshop on the iPad Pro can be a little sluggish at times, especially when using the Pencil as a brush and rotating layers in the paint bucket. This may be due to OpenGL getting a little bottlenecked when working with the Pencil (or it may be a balancing act of performance versus the need to protect against Apple's ever-moving goal line). Further issues in performance are most likely attributable to trying to get very detailed and precise with the Pencil as a brush, so this should improve with time. This leaves the software with a few major performance issues, the one that sticks out the most being what can also be described as \"over the top\" render times. These have been easily explainable, and hopefully can be fixed with a firmware update.

However, the potential costs of using more memory are usually covered by Adobe, if you buy the Photoshop software. As a beginner, you may be wondering which version of Photoshop is best.
