Layers allow you to divide a single picture file into layers. For example, you can add a background color to just a part of a pic, then you can move it to another part and so on until you cover the entire image. When you select different layers, you will see them with different colors. For instance, a color-green layer may be able to show an image that is a front view of a city. When you change the angle, the colors you saw are changing out of view of the city. In Photoshop, you can add a mask to a layer. By making the image pixels transparent, you can easily select a portion of the photo and cut it out. You can then copy that part and paste it elsewhere. A mask, however, will not play a part in any changes you make. If you apply a filter to your layer, the mask will always reflect that filter. Photoshop just got its channel image feature. This is extremely useful for fixing red, blue, green and purple artifacts and removing mid-tone noise. This may be the reason why so many professional photographers and multimedia developers make use of Photoshop. The reason for this is the high quality in the channeling. You can trim and refine very selectively, which makes it totally fine even for a little bit of noise. You can easily customize the overall appearance of your photo with the use of adjustment layers. These are basically a set of rectangular polar filters that you can use to fix the lights and dark spots in your file. These filters give you the ability to change the tonal values of your picture. You can down or up the toner values in the different areas to give your photo a more balanced look. A mask, of course, plays a vital role here. Because a single adjustment layer will cover the entire picture, you can still modify the mask when setting the adjustment values.
